PROFESSIONAL SKILLS

- HTML
- CSS
- BOOTSTRAP
- My SQL
- PHP
- LARAVEL
- MICROSOFT
OFFICE
- COMMUNICATION
SKILLS

EXPERIENCES

Site for storing and displaying data

Introducing the project:

- The site is built on the Laravel framework
- I used routes, views, and controller, which help us organize the project and divide it into more organized pages.
- The (Tailwindcss) library was used for the project, which contains the register page and the login page, to add security to the site data and user posts
- It is not possible to add a post on the site or modify it except by registering the user's email
- After the user registers the e-mail on the site, he can then add a new post, and he can only modify the post
- The site allows the user to upload and publish images
- If the (Read More) button is pressed, it will move to a page that displays all the information of the publication with buttons to edit or delete the publication
- Website data is stored in a (MySQL) database .
